RobotPy wrappers for the following Analog Devices products:

- ADIS16448
- ADIS16470

Note: The RobotPy project is not associated with or endorsed by Analog Devices Inc. or FIRST Robotics Competition

CHAPTER 1

Authors

- ADIS16448 support contributed by [@picode98](#)
- ADIS16470 support contributed by [@SHU-matic](#)

2.1 ADI API

This is not installed on the robot by default. For installation instructions, see [robotpy-adi install docs](#).

2.1.1 adis16448 Package

`adis16448.ADIS16448_IMU(*args, **kwargs)` Overloaded function.

ADIS16448_IMU

`class adis16448.ADIS16448_IMU(*args, **kwargs)`

Bases: `wpilib.GyroBase`

Overloaded function.

1. `__init__(self: adis16448._adis16448.ADIS16448_IMU) -> None`

IMU constructor on onboard MXP CS0, Z-up orientation, and complementary AHRS computation.

2. `__init__(self: adis16448._adis16448.ADIS16448_IMU, yaw_axis: adis16448._adis16448.ADIS16448_IMU.IMUAxis, port: wpilib._wpilib.SPI.Port, cal_time: int) -> None`

IMU constructor on the specified MXP port and orientation.

Parameters

- **yaw_axis** – The axis where gravity is present. Valid options are kX, kY, and kZ
- **algorithm** – The AHRS algorithm to use. Valid options are kComplementary and kMadgwick

- **port** – The SPI port where the IMU is connected.

```
class IMUAxis(arg0: int) → None
Bases: pybind11_builtins.pybind11_object
```

Members:

kX

kY

kZ

kX = IMUAxis.kX

kY = IMUAxis.kY

kZ = IMUAxis.kZ

name

(self: handle) -> str

calibrate() → None

Initialize the IMU.

Perform gyro offset calibration by collecting data for a number of seconds and computing the center value. The center value is subtracted from subsequent measurements.

It's important to make sure that the robot is not moving while the centering calculations are in progress, this is typically done when the robot is first turned on while it's sitting at rest before the match starts.

The calibration routine can be triggered by the user during runtime.

configCalTime (new_cal_time: int) → int

configDecRate (DecimationRate: int) → int

getAccelInstantX() → float

getAccelInstantY() → float

getAccelInstantZ() → float

getAngle() → float

Return the actual angle in degrees that the robot is currently facing.

The angle is based on the current accumulator value corrected by offset calibration and built-in IMU calibration. The angle is continuous, that is it will continue from 360->361 degrees. This allows algorithms that wouldn't want to see a discontinuity in the gyro output as it sweeps from 360 to 0 on the second time around. The axis returned by this function is adjusted based on the configured yaw_axis.

Returns the current heading of the robot in degrees. This heading is based on integration of the returned rate from the gyro.

getBarometricPressure() → float

getGyroAngleX() → float

getGyroAngleY() → float

getGyroAngleZ() → float

getGyroInstantX() → float

getGyroInstantY() → float

getGyroInstantZ() → float

getMagInstantX() → float
getMagInstantY() → float
getMagInstantZ() → float
getRate() → float
 Return the rate of rotation of the yaw_axis gyro.
 The rate is based on the most recent reading of the gyro value
Returns the current rate in degrees per second
getTemperature() → float
getXComplementaryAngle() → float
getXFilteredAccelAngle() → float
getYComplementaryAngle() → float
getYFilteredAccelAngle() → float
getYawAxis() → adis16448._adis16448.ADIS16448_IMU.IMUAxis
reset() → None
 Reset the gyro.
 Resets the gyro accumulations to a heading of zero. This can be used if there is significant drift in the gyro and it needs to be recalibrated after running.
setYawAxis(yaw_axis: adis16448._adis16448.ADIS16448_IMU.IMUAxis) → int

2.1.2 adis16470 Package

<i>adis16470.ADIS16470CalibrationTime(self, arg0)</i>	Members:
<i>adis16470.ADIS16470_IMU(*args, **kwargs)</i>	Overloaded function.

ADIS16470CalibrationTime

class adis16470.ADIS16470CalibrationTime(arg0: int) → None
 Bases: pybind11_builtins.pybind11_object

Members:

- _32ms
- _64ms
- _128ms
- _256ms
- _512ms
- _1s
- _2s
- _4s
- _8s

```
_16s  
_32s  
_64s  
name  
(self: handle) -> str
```

ADIS16470_IMU

```
class adis16470.ADIS16470_IMU(*args, **kwargs)  
Bases: wpilib.GyroBase
```

Overloaded function.

1. **__init__**(self: adis16470.adis16470.ADIS16470_IMU) -> None

Default constructor. Uses CS0 on the 10-pin SPI port, the yaw axis is set to the IMU Z axis, and calibration time is defaulted to 4 seconds.

2. **__init__**(self: adis16470.adis16470.ADIS16470_IMU, yaw_axis: adis16470.adis16470.ADIS16470_IMU.IMUAxis, port: wpilib._wpilib.SPI.Port, cal_time: adis16470.adis16470.ADIS16470CalibrationTime) -> None

Customizable constructor. Allows the SPI port and CS to be customized, the yaw axis used for GetAngle() is adjustable, and initial calibration time can be modified.

Parameters

- **yaw_axis** – Selects the “default” axis to use for GetAngle() and GetRate()
- **port** – The SPI port and CS where the IMU is connected.
- **cal_time** – The calibration time that should be used on start-up.

```
class IMUAxis(arg0: int) → None  
Bases: pybind11_builtins.pybind11_object
```

Members:

```
kX  
kY  
kZ  
kX = IMUAxis.kX  
kY = IMUAxis.kY  
kZ = IMUAxis.kZ  
name  
(self: handle) -> str
```

calibrate() → None

Switches the active SPI port to standard SPI mode, writes the command to activate the new null configuration, and re-enables auto SPI.

configCalTime(new_cal_time: adis16470.adis16470.ADIS16470CalibrationTime) → int

Switches the active SPI port to standard SPI mode, writes a new value to the NULL_CNFG register in the IMU, and re-enables auto SPI.

configDecRate(reg: int) → int

getAccelInstantX() → float

getAccelInstantY() → float

getAccelInstantZ() → float

getAngle() → float

Returns the current integrated angle for the axis specified.

The angle is based on the current accumulator value corrected by offset calibration and built-in IMU calibration. The angle is continuous, that is it will continue from 360->361 degrees. This allows algorithms that wouldn't want to see a discontinuity in the gyro output as it sweeps from 360 to 0 on the second time around. The axis returned by this function is adjusted based on the configured yaw_axis.

Returns the current heading of the robot in degrees. This heading is based on integration of the returned rate from the gyro.

getGyroInstantX() → float

getGyroInstantY() → float

getGyroInstantZ() → float

getRate() → float

getXComplementaryAngle() → float

getXFilteredAccelAngle() → float

getYComplementaryAngle() → float

getYFilteredAccelAngle() → float

getYawAxis() → adis16470._adis16470.ADIS16470_IMU.IMUAxis

initSendable(builder: wpilib._wpilib.SendableBuilder) → None

m_yaw_axis

reset() → None

Resets (zeros) the xgyro, ygyro, and zgyro angle integrations.

Resets the gyro accumulations to a heading of zero. This can be used if the “zero” orientation of the sensor needs to be changed in runtime.

setYawAxis(yaw_axis: adis16470._adis16470.ADIS16470_IMU.IMUAxis) → int
